Favourite Things Roadmap - NXH

Pick 3 things you love and create an app that showcases those things. Design a database that contains at least 4 columns - you must include an image of some kind and descriptive data about each of those things. Use the class authoring files as a reference - however DO NOT use the design files - make something better

What the app does:

- Show 3 favourite things of mine (pets)
- For each pet, shows the image, pet name, the animal type and brief description of it

Considerations:

- The variable names and function names must be correct or else the function will break
- To retrieve the data, the database / table name must be correct
- Be careful with the objects' class-name as well because the step where we clone the template to pet-section is quite tricky
- For the sass to work, the <template> tag must be outside of the <body> tag
